ABSTRACT

A method and system for communicating data inspecting, monitoring and analysis information by signaling between digital devices is described. A process analyzes the data, which is then subjected to a variety of inspection and validation methods and systems. The results created by the process are then used to signal a grade and rating of the data to specified recipients. Additionally, selected reporting and notification are also sent to specified recipients. Dynamic control of the process is provided if specific information is also received for the information to be processed.
